UC8230s

Single-Chip, Ultra-Low Power 240RGB x 320 Gate Matrix Active Color LCD Controller-Driver

INTRODUCTION

The UC8230s handles 262,144 TFT colors and can drive a TFT color liquid crystal display of 240 RGB x 320 dots with an incorporated RAM compliant to graphics display of 240 RGB x 320 dots at maximum, and a 720-channel source driver outputs. The UC8230s incorporates a gate driver and a power circuit for driving liquid crystal display to drive a TFT panel with a single chip.

The UC8230s' bit-operation functions, 8/9/16/18-bit high-speed bus interface, and high-speed RAM-write functions enable efficient transfer of data and high-speed data update on a graphics RAM. The UC8230s' 6/16/18-bit RGB interface (VSYNC, HSYNC, DOTCLK, ENABLE, and DB17 to 0) and VSYNC interface (system interface + VSYNC) provide an interface for moving picture display.

With a window address function that facilitates the moving picture display in an arbitrary area and enables simultaneous display of moving pictures and the contents of the internal RAM, the UC8230s enables moving picture display not constrained by the still picture area. Accordingly, the data transmission is reduced to minimum, thereby saving power consumed by a system as a whole when displaying moving pictures.

The UC8230s supports power-saving operation up to the power supply voltage of 2.5V with a voltage follower circuit that generate voltage to drive liquid crystal. The UC8230s also incorporates 8-color display and standby functions that allow precise power control by software.

These features make this LSI the ideal solution for any medium or small-sized portable battery-driven products such as digital cellular phones supporting WWW browsers or small PDA, where long battery life and board size are major concern.

MAIN APPLICATIONS

 Cellular Phones and other battery operated hand held devices or portable Instruments.

FEATURE HIGHLIGHTS

- Liquid crystal controller/driver for 262,144 TFT-color 240RGB x 320-dot graphics display
- Single chip solution for a TFT display panel
- System interface
 - 8-/9-/16-/18-bit high-speed bus interface
 - Serial Peripheral Interface (SPI)
 - 8-bit transmission x 3 times (262k/65k color modes)
- Interface for moving picture display
 - 6-/16-/18-bit RGB interface (VSYNC, HSYNC, DOTCLK, ENABLE, DB17-0)
 - VSYNC interface (System interface + VSYNC)
- Window address function to write data to the rectangular area of RAM specified by the window address
 - Interface to facilitate moving picture display in an arbitrary area
 - Reduce data transmission by transmitting only the data for the moving picture display area
 - Simultaneous display of moving pictures and the contents of the internal RAM
- Functions for controlling abundant color displays
 - Simultaneous availability of 262,144 colors with v-correction function
 - Line-unit vertical scrolling

- Low-power architecture: features for lowpower operation
 - $V_{cc} = 2.5 \sim 3.3 \text{ V}$ (internal logic regulator power supply circuit)
 - $I/OV_{CC} = 1.8 \sim 3.3V$ (reference voltage for interface pin input)
 - $V_{D4} = 4.2 \sim 5.2 \text{ V}$ (Source/COMH/P16V-Pump drive voltage)
 - Power saving function (standby mode etc.)
 - Partial liquid crystal drive to display two screens at arbitrary positions
 - Voltage followers for liquid crystal drive power circuit to fend off the direct current from bleeder-resistors
- Step-up circuit generating liquid crystal drive voltage up to 6-time scale
- 172,800-byte internal RAM
- Incorporated liquid crystal display driver with 720 source outputs and 320 gate outputs
- n-raster-row liquid crystal AC drive, enabling polarity inversion by every arbitrary number of raster-rows
- Internal oscillation and hardware reset
- Reversible direction of signals between RAM and source driver
- Exclusive for Cst structure

ORDERING INFORMATION

Gold Bumped Die

Part Number	MTP	Description
UC8230sGAA	Yes	Gold bumped die, with MTP function.

General Notes

APPLICATION INFORMATION

For improved readability, the specification contains many application data points. When application information is given, it is advisory and does not form part of the specification for the device.

BARE DIE DISCLAIMER

All die are tested and are guaranteed to comply with all data sheet limits up to the point of wafer sawing. There is no post waffle saw/pack testing performed on individual die. Although the latest processes are utilized for wafer sawing and die pick-&-place into waffle pack carriers, UltraChip has no control of third party procedures in the handling, packing or assembly of the die. Accordingly, it is the responsibility of the customer to test and qualify their applications in which the die is to be used. UltraChip assumes no liability for device functionality or performance of the die or systems after handling, packing or assembly of the die.

MTP LIGHT & ESD SENSITIVITY

The MTP memory cell is sensitive to photon excitation and ESD. Under extended exposure to strong ambient light, or when TST4 pin is exposed to ESD strikes, the MTP cells can lose its content before the specified memory retention time span. The system designer is advised to provide proper light & ESD shields to realize full MTP content retention performance.

LIFE SUPPORT APPLICATIONS

These devices are not designed for use in life support appliances, or systems where malfunction of these products can reasonably be expected to result in personal injuries. Customer using or selling these products for use in such applications do so at their own risk.

CONTENT DISCLAIMER

UltraChip believes the information contained in this document to be accurate and reliable. However, it is subject to change without notice. The information and data provided herein is for reference only. No responsibility is assumed by UltraChip for the use of information contained in this datasheet. Always contact UltraChip for commit to mass production for the latest product information and operation parameters.

High-Voltage Mixed-Signal IC

PIN DESCRIPTION

Name	Туре	Type Pads Description							
	Power								
V _{CC}	I	18	VD1-regulator / BGR / LVD power supply - external power supply. Range: 2.5v~3.3v						
IOV _{CC}	1	6	Interface pin power supply - external power supply. Range: 1.65~3.3						
V _{SS}	GND	13	Chip ground						
V_{S2}	GND	8	Pump ground						
V_{DD}	0	11	Logic/memory power supply - connected internally to VD1 regulator output. 1.8V						
V_{D2}	0	3	V _{D2} output pin						
V _{D1_ON} V _{D2_ON}	0	1 1	VD1 test pin (For Ultrachip test only) VD2 test pin (For Ultrachip test only)						
V_{D4}	0	6	Source/comH/VCCH-pump/VCCL-pump Voltage: V _{D2} x 2						
V _{CC} H	0	6	Gate high power supply. Voltage: V _{D2} x 4,5,6						
V _{CC} L	0	10	Gate low power supply. Voltage: V _{D2} x -3,-4,-5						
V _{SN}	0	5	comL power supply. Voltage: V _{D2} x (-1)						
			MPU-IF						
IM3~0		4	Select MPU-IF mode IM[3:0] Bus Mode DB Pin 0000 6800 / 16-bit DB17-10, DB8-1 0001 6800 / 8-bit DB17-10 0010 8080 / 16-bit DB17-10, DB8-1 0011 8080 / 8-bit DB17-10 010, ID SPI DB17-0 011* Setting disabled 1000 6800 / 18-bit DB17~0 1001 6800 / 9-bit DB17-9 1010 8080 / 18-bit DB17~0 1011 8080 / 9-bit DB17-9 11*** Setting disabled						
CSb	I	1	Chip select, 500nS filter, R=25K(HR-Poly), C=20pF connect to V_{DD}						
RS	I	1	Select IR/SR (RS_) or CRs (RS)						
WR_SCL	I	1	80-system: write_; SPI: sync clock						
RDb	I	1	80-system: read_; SPI: fixed to V _{DD} or V _{SS}						
DB17~0	I/O	18	MPU data bus						
SDI, SDO	I, O	1, 1	SDI : Serial Data Input. SDO : Serial Data Output						
RESETb	I	2	Initialize chip						

Name	Туре	Pads Description						
DISPLAY-IF								
VSYNC	I	1	Frame synchronization signal					
HSYNC	I	1	Line synchronization signal					
DOTCLK	I	1	Dot clock					
ENABLE	I	1	Enable signal in RGB-mode					
FMARK	0	1	Frame head pulse with amplitude between GND and IOV _{CC} . Use when writing data to RAM in synchronization with FMARK. Leave open when not used.					
			REF/OSC					
VREG1	I/O	3	Reference voltage for generating gamma curve					
		Extern	AL PUMPING CAPACITOR					
C11+, C11-	I/O	5, 5	Connect to external pumping capacitor C11					
C12+, C12-	I/O	5, 5	Connect to external pumping capacitor C12					
C13+, C13-	I/O	4, 4	Connect to external pumping capacitor C13					
C21+, C21-	I/O	7, 7	Connect to external pumping capacitor C21					
C22+, C22-	I/O	7, 7	Connect to external pumping capacitor C22					
			Соммон					
СОМ	0	7	TFT common electrode					
COM_TEST	0	1	TFT common electrode test pin					
VcomH	0	6	High level of Vcom					
VcomL	0	4	Low level of Vcom					
			Source					
S1~S720	0	720	TFT source electrode					
VGS	1	2	Adjust gamma curve to match different panel					
			GATE					
G1~G320	0	320	TFT gate electrode					
	Misc.							
DUMMY	0	46	Dummy					
OSC	1	1	Input pin for external clock input.					
SRC_TEST	0	1	Source output test pin					

RECOMMENDED COG LAYOUT

(TBD)

Note for V_{DD} and V_{SS} with COG:

The operation condition V_{DD1} = 1.8V (typical) must be satisfied under all operating conditions. With its video capability, UC8230s peak current (I_{DD}) can be up to ~15mA range during high speed data write to UC8230s' on-chip SRAM. Such high pulsing current mandates very careful design of V_{DD} , V_{SS} layout in COG glass modules. When V_{DD} and V_{SS} trace resistance is not low enough, the pulsing I_{DD} current can cause the actual on-chip V_{DD} to drop below 1.65V and cause the IC to malfunction.

CONTROL REGISTERS

High-Voltage Mixed-Signal IC

UC8230s contains registers which control the chip operation. These registers can be modified by commands. The following table is a summary of the control registers, their meanings and their default values. Commands supported by UC8230s will be described in the next two sections. First, a summary table, followed by a detailed instruction-by-instruction description.

Name: The Symbolic reference of the register.

Note that, some symbol name refers to bits (flags) within another register.

Numbers shown in **Bold** font are default values after *Power-Up-Reset* and *System-Reset*. Default:

Name	Bits	Default	Description				
			Description				
ID7-0	8	00h	Specifies index (R00h to RFFh) of the control register				
OS	1	0h	"1": Start power-up sequence,				
AOF	1	0h	"1": Auto power-off (Display off).				
TE	1	0h	MTP Write Control 0: Data-write End 1: Data-write Start				
MTPS	1	0h	MTP Succeed				
MAN	1	1h	1 : Enable power setup & display sequence MANual mode				
DID	16	8230h	Device ID, = 8230h.				
SS	1	0h	Shift direction of Source order: 0: S1 to S720 1: S720 to S1 Rewrite the RAM data when change SS bit SS=0 DB[17:0] = {S(3n), S(3n+1), S(3n+2)}, n=0240 SS=1 DB[17:0] = {S(3n+2), S(3n+1), S(3n)}, n=2400				
SM	1	0h	Specifies the scan order of gate driver, 0 : progressive 1 : interlace				
EOR	1	0h	When "1", polarity inversion of a C-pattern waveform (B/C=1) occur by applying an EOR to an odd/even frame select signal and an N-line inversion signal.				
BC0	1	0h	0 : select frame inversion 1 : select n-line inversion, and n-line =1				
AM	1	0h	0 : horizontally write to GRAM 1 : vertically write to GRAM				
I/D	2	3h	Address counter increment / decrement by 1 after write to GRAM I/D1 : Vertical. 0 : decreasing 1 : increasing 1 : increasing				
ORG	1	0h	Moves the origin address according to the ID setting when a window address area is made. ORG = 0 : The origin address is not moved. ORG = 1 : The origin address "h00000" is moved according to the I/D[1:0] setting.				
BGR	1	0h	Reverses the order of RGB dots to BGR for the 18-bit data written to the internal GRAM				
			BGR=0 S(3n): red S(3n+1): green S(3n+2): blue				
			BGR=1 S(3n): blue S(3n+1): green S(3n+2): red				

Name	Bits	Default	Descrip	otion					
DFM	1	0h	0 : 262	Specifies the Data Format when TRI=1 and using 8-bit or SPI interface 0: 262k mode (6,6,6 transfer) 1: 65k mode (5,6,5 transfer)					
TRI	1	0h		M write o		a for a p	oixel are transferred 3 times through the 8-bits

COMMAND DESCRIPTION

(1) INDEX (IR)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	0	0	0	0	0	0	0	0	0				ID[7:0]			

The index register specifies the index R00h to RFFh of the control register or RAM control to be accessed using a binary number from "0000_0000" to "1111_1111". The access to the register and instruction bits in it is prohibited unless the index is specified in the index register.

(2) STATUS READ (SR)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
R	0	0	0	0	0	0	0	0	0	0	TE	MTPS	0	0	0	0	0

MTPS : MTP succeed

TE : MTP write control

0 : Data write end

1 : Data write Start

(3) SET DISPLAY ENABLE (R00H)

I	W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
	W	1	0	0	0	0	0	0	0	0	0	0	0	0	0	AOF	MAN	os

OS: 1 - Start power-up sequence.

MAN: Manual mode.

0b : Auto mode 1b : Manual mode power setup & display sequence.

AOF: "1" - Auto Power Off (Display OFF).

(4) DRIVE CODE READ

W/I	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	1	0	0	0	0	0	1	0	0	0	1	1	0	0	0	0

The device code "8230"H is read out when reading out this register forcibly.

(5) DRIVE OUTPUT CONTROL (R01H)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0	0	SM	0	SS	0	0	0	0	0	0	0	0

SS: Sets the shift direction of output from the source driver.

When SS = "0", the source driver output shift from S1 to S720.

When SS = "1", the source driver output shift from S720 to S1.

The combination of SS and BGR settings determines the RGB assignment to the source driver pins S1 \sim S720.

When SS = "0" and BGR = "0", RGB dots are assigned one to one from S1 to S720. When SS = "1" and BGR = "1", RGB dots are assigned one to one from S720 to S1.

When changing the SS and BGR bits, RAM data must be rewritten.

SM: Controls the scan mode in combination with GS setting. See "Scan mode setting".

(6) LCD DRIVE WAVEFORM CONTROL (R02H)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0	0	1	BC0	EOR	0	0	0	0	0	0	0	0

EOR: Enables liquid-crystal line-inversion drive when EOR = 1 and BC0 = 1.

BC0: Selects the liquid crystal drive waveform VCOM.

BC = 0: frame inversion waveform is selected.

BC = 1: line inversion, line inverted=1

In either liquid crystal drive method; the polarity inversion is halted in blank period (back and front porch periods).

(7) ENTRY MODE (R03H)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	TRI	DFM	0	BGR	0	0	0	0	ORG	0	ID1	ID0	AM	0	0	0

The entry mode register includes instruction bits for setting how to write data from the microcomputer to the internal GRAM of the UC8230s.

AM: Sets either horizontal or vertical direction in updating the address counter automatically as the UC8230s writes data to the internal GRAM.

AM = "0", sets the horizontal direction.

AM = "1", sets the vertical direction.

When making a window address area, the data is written only within the area in the direction determined by I/D1-0, AM bits.

I/D[1:0]: Either increase (+1) or decrease (-1) the address counter (AC) automatically as the data is written to the GRAM. The I/D[0] bit sets either increment or decrement in horizontal direction (updates the address AD[7:0]). The I/D[1] bit sets either increment or decrement in vertical direction (updates the address AD[8:16]). The AM bit sets either horizontal or vertical direction in updating RAM address counter automatically when writing data to the internal RAM.

ORG: Moves the origin address according to the ID setting when a window address area is made. This function is enabled when writing data within the window address area using high-speed RAM write function. Also see Figure 1 and Figure 2.

ORG = 0: The origin address is not moved. In this case, specify the address to start write operation according to the GRAM address map within the window address area.

ORG = 1: The origin address "h00000" is moved according to the I/D[1:0] setting.

Notes:

- 1. When ORG = 1, only the origin address "h00000" can be set in the RAM address set registers (R20h, R21h).
- 2. In RAM read operation, make sure to set ORG = 0.

HWM: The UC8230s writes data in high speed with low power consumption by setting HWM = 1. The data to be written within the window address area is buffered in order to write the data in units of horizontal lines. This can minimize the number of RAM access and the power consumption required in data write operation.

When HWM = 1, make sure to set AM = 0 (horizontal direction) and write the data in each horizontal line of the window address area at a time. If the data is not enough to rewrite the horizontal line of the window address area, the GRAM data in that line is not overwritten.

Notes:

- 1. The UC8230s requires no dummy write operation in high-speed write operation.
- 2. When terminating RAM data write operation in the middle of the line and executing another instruction, the data in the buffer is cleared.

3. When switching from high-speed RAM write operation to index write operation, wait at least 2 normalwrite cycle periods (2 tcycw periods).

BGR: Reverses the order from RGB to BGR in writing 18-bit pixel data in the GRAM.

BGR = 0: Write data in the order of RGB to the GRAM.

BGR = 1: Reverse the order from RGB to BGR in writing data to the GRAM.

	D17	D16	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
BGR = 0	R5	R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	G0	B5	B4	B3	B2	B1	B0
BGR = 1	B5	B4	В3	B2	B1	В0	G5	G4	G3	G2	G1	G0	R5	R4	R3	R2	R1	R0

DFM: In combination with the TRIREG setting, sets the format to develop 16-/8-bit data to 18-bit data when using either 16-bit or 8-bit bus interface. Make sure to set DFM = 0 when not transferring data via 16-bit or 8bit interface.

TRIREG: Selects the format to transfer data bits via 16-bit or 8-bit interface.

In 8-bit interface operation,

TRIREG = 0: 16-bit RAM data is transferred in two transfers.

TRIREG = 1: 18-bit RAM data is transferred in three transfers.

In 16-bit bus interface operation,

TRIREG = 0: 16-bit RAM data is transferred in one transfer.

TRIREG = 1: 18-bit RAM data is transferred in two transfers.

Make sure TRIREG = 0 when not transferring data via 16-bit or 8-bit interface. Also, set TRIREG = 0 during read operation.

Figure 1 Automatic address update (ORG = 0, AM, ID)

Note:

When writing data within the window address area with ORG = 0, any address within the window address area can be designated as the starting point of RAM write operation.

Figure 2 Automatic address update (ORG = 1, AM, ID)

Notes:

- 1. When ORG = 1, make sure to set the address "h00000" in the RAM address set registers (R210h, R21h). Setting other addresses is inhibited.
- 2. When ORG = 1, the starting point of writing data within the window address area can be set at either corner of the window address area ("S" in circle in the above figure).

(8) RESIZE CONTROL (R04H)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0	0	0	RCV	/[1:0]	0	0	RCH	[1:0]	0	0	RSZ	[1:0]

RSZ[1:0]: Sets the resizing factor. When the RSZ bits are set for resizing, the UC8230s writes the data according to the resizing factor so that the original image is displayed in horizontal and vertical dimensions contracted according to the factor. See "Resizing function".

RCH[1:0]: Sets the number of pixels made as the remainder in horizontal direction when resizing a picture. By specifying the number of remainder pixels with RCH bits, the data can be transferred without taking the reminder pixels into consideration. Make sure that RCH = 2'h0 when not using the resizing function (RSZ = 2'h0) or there are no remainder pixels.

RCV[1:0]: Sets the number of pixels made as the remainder in vertical direction when resizing a picture. By specifying the number of remainder pixels with the RCV bits, the data can be transferred without taking the reminder pixels into consideration. Make sure that RCV = 2'h0 when not using the resizing function (RSZ = 2'h0) or there are no remainder pixels.

Table 1 Resizing factor (RSR)

RSZ [1:0]	Resizing Scale
2'b0	No resizing (x1)
2'b1	x 1/2
2'b2	Setting inhibited
2'b3	x 1/4

Table 2 Remainder Pixels in Horizontal Direction (RCH)

RCH [1:0]	Number of remainder Pixels in Horizontal Direction
2'b0	0 pixel
2'b1	1 pixel
2'b2	2 pixels
2'b3	3 pixels

Table 3 Remainder Pixels in Vertical Direction (RCV)

RCV [1:0]	Number of remainder Pixels in Vertical Direction
2'b0	0 pixel
2'b1	1 pixel
2'b2	2 pixels
2'b3	3 pixels

Note: 1 pixel = 1RGB

(9) DISPLAY CONTROL 1 (R07H)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	PTDE	E[1:0]	0	0	0	BASE E	0	VON	GON	DTE	COL	0	D[1	1:0]

D[1:0]: A graphics display is turned on when writing D1 = "1", and is turned off when writing D1 = "0". When writing D1 = "0", the graphics display data is retained in the internal GRAM and the UC8230s displays the data when writing D1 = "1". When D1 = "0", i.e. while no display is shown on the panel, all source outputs becomes the GND level to reduce charging/discharging current, which is generated within the LCD while driving liquid crystal with AC voltage.

When the display is turned off by setting D1-0 = 2'b01, the UC8230s continues internal display operation. When the display is turned off by setting D1-0 = 2'b00, the UC8230s' internal display operation is halted completely. In combination with the GON setting, the D[1:0] setting controls display ON/OFF. For details, see "Instruction Setting".

Table 4 Source output level and display operation

D[1:0]	BASEE	Source Output (S1-720)	FMARK signal	Internal Operation
2'h0	*	GND	Halt	Halt
2'h1	*	GND	Operation	Operation
2'h2	*	Non-lit display	Operation	Operation
2'h3	0	Non-lit display	Operation	Operation
2113	1	Base-image display	Operation	Operation

Notes:

- 1: The data write operation from the microcomputer is not affected by the D[1:0] setting.
- 2: The PTS bits set the source output level for "Non-lit display".
- 3: The LCD drive level during non-lit display period is determined by NDL setting.

COL: When COL = 1, 62 grayscale amplifiers other than V0 and V63 halt to display using less power. When setting 8-color display mode, follow the sequence of 8-color display mode setting.

Table 5

COL	Operating amplifier	Display color
0	32	262,144
1	2	8

Note: When COL = 1, do not write the data corresponding to the grayscales, for which the operation of amplifier is halted.

GON, DTE: The combination of GON and DTE settings set the output level form gate lines (G1 ~ G320). When GON = 0, the VCOM output level becomes the GND level.

Table 6

APE	GON	DTE	G1~G320
0	*	*	VGL (= GND)
	0	0	VGH
1	0	1	VGH
	1	0	VGL
	1	1	VGH/VGL

VON: Controls VCOMH, VCOML, VCOM amplitude signal output.

Table 7

APE	AP[1:0]	VON	VCOM output
0	*	*	GND
	0	0	GND
1	0	1	Setting disabled
1	1 ~ 3	0	GND
	1 ~ 3	1	VCOMH/VCOML

BASEE: Base image display enable bit.

BASEE = 0: No base image is displayed. The UC8230s drives liquid crystal with non-lit display level or drives only partial image display areas.

BASEE = 1: A base image is displayed on the screen.

The D[1:0] setting has precedence over the BASEE setting.

PTDE[1:0]: PTDE[0] is the display enable bit of partial image 1. PTDE[1] is the display enable bit of partial image 2. When PTDE1/0 = 0, the partial image is turned off and only base image is displayed on the screen. When PTDE1/0 = 1, the partial image is displayed on the screen. In this case, turn off the base image by setting BASEE = 0.

(10) DISPLAY CONTROL 2 (R08H)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0		FP[3:0]		0	0	0	0		BP[3:0]	

FP [3:0]: Sets the number of lines for a front porch period (a blank period following the end of display).BP [3:0]: Sets the number of lines for a back porch period (a blank period made before the beginning of display).

In external display interface operation, a back porch (BP) period starts on the falling edge of the VSYNC signal and the display operation starts after the back porch period. A blank period will start after a front porch (FP) period and it will continue until next VSYNC input is detected.

Note to Setting BP and FP: Set the BP and FP bits as follows in respective operation modes.

Table 8 BP and FP Settings

•				
Internal clock operation mode	BP ≥ 2 lines	FP ≥ 2 lines	FP + BP ≤ 16 lines	
RGB interface operation	BP ≥ 2 lines	FP ≥ 2 lines	FP + BP ≤ 16 lines	
VSYNC interface operation	BP ≥ 2 lines	FP ≥ 2 lines	FP + BP = 16 lines	

Table 9 Front and Back Porch period (Line periods)

FP[3:0] BP[3:0]	Front and Back Porch period (Line periods)
4'h0	Setting inhibited
4'h1	Setting inhibited
4'h2	2 lines
4'h3	3 lines
4'h4	4 lines
4'h5	5 lines
4'h6	6 lines
4'h7	7 lines
4'h8	8 lines
4'h9	9 lines
4'hA	10 lines
4'hB	11 lines
4'hC	12 lines
4'hD	13 lines
4'hE	14 lines
4'hF	Setting inhibited

Note: The output timing to the LCD panel is delayed by two line periods from the synchronous signal (VSYNC) input timing.

Figure 3 Front and Back Porch periods

(11) DISPLAY CONTROL 3 (R09H)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0	0	0	PTS	5[1:0]	0	0	PTG	[1:0]		ISC[3:0]	

ISC [3:0]: Set the scan cycle when PTG[1:0] selects interval scan in non-display area drive period. The scan cycle is defined by n frame periods, where n is an odd number from 3 to 31. The polarity of liquid crystal drive voltage from the gate driver is inverted in the same timing as the interval scan cycle.

Table 10

ISC[3:0]	Scan cycle	Time for interval when (fFLM) = 60Hz	ISC[3:0]	Scan cycle	Time for interval when (fFLM) = 60Hz
4'h0	Setting disabled	-	4'h8	17 frames	284mS
4'h1	3 frames	50mS	4'h9	19 frames	317mS
4'h2	5 frames	84mS	4'hA	21 frames	351mS
4'h3	7 frames	117mS	4'hB	23 frames	384mS
4'h4	9 frames	150mS	4'hC	25 frames	418mS
4'h5	11 frames	184mS	4'hD	27 frames	451mS
4'h6	13 frames	217mS	4'hE	29 frames	484mS
4'h7	15 frames	251mS	4'hF	31 frames	518mS

PTG[1:0]: Sets the scan mode in non-display area. The scan mode selected by PTG[1:0] bits is applied in the non-display area when the base image is turned off and the non-display area other than the first and second partial display areas.

Table 11

PTG[1]	PTG[0]	Scan mode in non-display area	Source output level in non-display area	VCOM output
0	0	Normal scan	PTS[2:0] setting	VCOMH/VCOML amplitude
0	1	Setting disabled	-	-
1	0	Interval scan	PTS[2:0] setting	VCOMH/VCOML amplitude
1	1	Setting disabled	-	-

Note: Select frame-inversion AC drive when interval scan is selected.

PTS[2:0]: Sets the source output level in non-display area drive period. When PTS[2] = 1, the operation of amplifiers which generates the grayscales other than V0 and V63 are halted and the step-up clock frequency becomes half the normal frequency in non-display drive period in order to reduce power consumption.

Table 12 Source output level and voltage generating operation in non-display drive period

PTS[2:0]	Source output le	evel	Grayscale amplifier	Step-up clock frequency
1 10[2.0]	Pos. polarity	Neg. polarity	in operation	Step-up clock frequency
3'h0	V63	V0	V0 to V63	Register setting (DC0, DC1)
3'h1	Setting inhibited	Setting inhibited	-	-
3'h2	GND	GND	V0 to V63	Register setting (DC0, DC1)
3'h3	Hi-Z	Hi-Z	V0 to V63	Register setting (DC0, DC1)
3'h4	V63	V0	V0 and V63	1/2 the frequency set by DC0, DC1
3'h5	Setting inhibited	Setting inhibited	-	-
3'h6	GND	GND	V0 and V63	1/2 the frequency set by DC0, DC1
3'h7	Hi-Z	Hi-Z	V0 and V63	1/2 the frequency set by DC0, DC1

Notes: 1. The power efficiency improved by halting grayscale amplifiers and slowing down the step-up clock frequency can be obtained in non-display drive period.

2. The gate output level in non-display drive period is controlled by the PTG setting (off-scan mode).

(12) DISPLAY CONTROL 4 (ROAH)

W/	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0	0	0	0	0	0	0	0	0	FMAR KOE		FMI[2:0]	

FMI[2:0]: Sets the output interval of FMARK signal according to the display data rewrite cycle and data transfer rate.

FMARKOE: When FMARKOE = 1, the UC8230s starts outputting FMARK signal from the FMARK pin in the output interval set by FMI[2:0] bits.

Table 13

FMI[2]	FMI[1]	FMI[0]	Output interval
0	0	0	1 frame
0	0	1	2 frames
0	1	1	4 frames
1	0	1	6 frames
Other so	ettings		Setting disabled

(13) EXTERNAL DISPLAY INTERFACE CONTROL 1 (R0CH)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	ı	ENC[2:0]	0	0	0	RM	0	0	DM[1:0]	0	0	RIM	[1:0]

RIM[1:0]: Sets the interface format when RGB interface is selected by RM and DM bits. Set RIM[1:0] bits before starting display operation via RGB interface. Do not change the setting while the UC8230s performs display operation.

Table 14 RGB interface operation

RIM[1:0]	RGB Interface operation	Colors
2'h0	18-bit RGB interface (1 transfer/pixel) via DB17-0	262,144
2'h1	16-bit RGB interface (1 transfer/pixel) via DB17-13 and DB11-1	65,536
2'h2	6-bit RGB interface (3 transfers/pixel) via DB17-12	262,144
2'h3	Setting inhibited	-

Notes: 1: Instruction bits are set via system interface.

Transfer the RGB dot data one by one in synchronization with DOTCLK in 6-bit RGB interface operation.

DM[1:0]: Selects the interface for the display operation. The DM[1:0] setting allows switching between internal clock operation mode and external display interface operation mode. However, switching between the RGB interface operation mode and the VSYNC interface operation mode is prohibited.

Table 15 Display Interface

DM[1:0]	Display Interface
2'h0	Internal clock operations
2'h1	RGB interface
2'h2	VSYNC interface
2'h3	Setting inhibited

RM: Selects the interface for RAM access operation. RAM access is possible only via the interface selected by the RM bit. Set RM = 1 when writing display data via RGB interface. When RM = 0, it is possible to write data via system interface while performing display operation via RGB interface.

Table 16 RAM Access Interface

RM	RAM Access Interface
0	System interface/VSYNC interface
1	RGB interface

ENC[2:0]: Sets the RAM write cycle via RGB interface.

Table 17 RAM Write Cycle

ENC[2:0]	RAM Write Cycle (frame periods)
3'h0	1 frame
3'h1	2 frames
3'h2	3 frames
3'h3	4 frames
3'h4	5 frames
3'h5	6 frames
3'h6	7 frames
3'h7	8 frames

(14) FRAME MARKER CONTROL (RODH)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0	0	0	0				F	MP[8:0]			

FMP[8:0]: Sets the output position of frame cycle signal (frame marker). When FMP[8:0] = 9'h000, a high-active pulse FMARK is outputted at the start of back porch period for 1H period (IOVCC-IOGND amplitude signal). FMARK can be used as the trigger signal for frame synchronous write operation. See "FMARK" for details.

Make sure the setting restriction 9'h000 ≤ FMP ≤ BP+NL+FP.

Table 18

FMP[8:0]	FMARK output position
9' h000	0th line
9' h001	1st line
9' h002	2nd line
:	*
9' h14E	334th line
9' h14F	335th line
9' h150~1FF	Setting disabled

(15) EXTERNAL DISPLAY INTERFACE CONTROL 2 (R0FH)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0	0	0	0	0	0	0	0	VSPL	HSPL	0	EPL	DPL

DPL: Sets the signal polarity of DOTCLK pin.

DPL = 0: input data on the rising edge of DOTCLK DPL = 1: input data on the falling edge of DOTCLK

EPL: Sets the signal polarity of ENABLE pin.

EPL = 0: writes data DB17-0 when ENABLE = "0" and

disables data write operation when ENABLE = "1". EPL = 1: writes data DB17-0 when ENABLE = "1" and

disables data write operation when ENABLE = "0".

HSPL: Sets the signal polarity of HSYNC pin.

HSPL = 0: low active HSPL = 1: high active

VSPL: Sets the signal polarity of VSYNC pin.

VSPL = 0: low active VSPL = 1: high active

SLP: When SLP = 1, the UC8230s enters the sleep mode. In sleep mode, the internal display operation except RC oscillation is halted to reduce power consumption. No change to the GRAM data and instruction setting is accepted and he GRAM data and the instruction setting are maintained in sleep mode.

DSTB: When DSTB = 1, the UC8230s enters the deep standby mode. In deep standby mode, the internal logic power supply is turned off to reduce power consumption. The GRAM data and instruction setting are not maintained when the UC8230s enters the deep standby mode, and they must be reset after exiting deep standby mode.

AP[1:0]: Adjusts the constant current in the operational amplifier circuit in the LCD power supply circuit. The larger constant current enhances the drivability of the LCD, but it also increases the current consumption. Adjust the constant current taking the trade-off into account between the display quality and the current consumption. In no-display period, set AP1-0 = 2'h0 to halt the operational amplifier circuits and the step-up circuits to reduce current consumption.

Table 19 Constant current in amplifier in LCD power supply, grayscale voltage generating circuits

AP[1:0]	LCD power supply circuits	Grayscale voltage generating circuit
2'h0	Halt operation	Halt operation
2'h1	0.5	0.62
2'h2	0.75	0.71
2'h3	1	1

Note: In this table, the constant current in operational amplifiers is the ratio to the constant current when AP[1:0] is set to 2'h3.

APE: Liquid crystal power supply enable bit. Set APE = 1 and follow the sequence when starting up the liquid crystal power supply.

Table 20

APE	Liquid crystal power supply circuit	Grayscale voltage generating circuit
0	Halt	Halt
1	Operate	Operate

BT[3:0]: Sets the factor used in the step-up circuits. Select the optimal step-up factor for the operating voltage. To reduce power consumption, set a smaller factor.

BT	vdd4_pump	vcch_pump	vccl_pump
000	VD2 x 2	VD2 x 4	VD2 x (-3)
001	VD2 x 2	VD2 x 4	VD2 x (-4)
010	VD2 x 2	VD2 x 5	VD2 x (-3)
011	VD2 x 2	VD2 x 5	VD2 x (-4)
100	VD2 x 2	VD2 x 5	VD2 x (-5)
101	VD2 x 2	VD2 x 6	VD2 x (-3)
110	VD2 x 2	VD2 x 6	VD2 x (-4)
111	VD2 x 2	VD2 x 6	VD2 x (-5)

SAP: The grayscale voltage generating circuit is halted by setting SAP = 0. Grayscale voltages are generated when SAP = 1. When starting the operation of LCD power supply circuit in Power ON operation and so on, make sure SAP = 0. Set SAP = 1, after starting up the LCD power supply circuit. LVDTEN: "1" - Low-VCC detection control Enabled.

VC[2:0]:

(17) SETTING DISABLE (R17H)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	PSE

PSE: Power supply startup enable bit.

- PSE = 1: The UC8230s' power supply is started by setting PON1, PON2, and PON4 when PSE =1. When completing the power supply generating operation, PSE is set to 0.
- PSE = 0: Power supply sequencer is reset. When halting the operating power supply sequencer, set PSE = 0. When starting up power supply without power supply sequencer, set PSE = 0. The power sequencer enables the register settings sequentially at the designated timing and order.

(18) RAM ADDRESS SET - HORIZONTAL (R20H)

(19) RAM ADDRESS SET - VERTICAL (R21H)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0	0	0	0	0		AD[7:0]						
W	1	0	0	0	0	0	0	0					AD[16:8]			

AD[16:0]: A GRAM address set initially in the AC (Address Counter). The address in the AC is automatically updated according to the combination of AM, I/D[1:0] settings as the UC8230s writes data to the internal GRAM so that data can be written consecutively without resetting the address in the AC. The address is not automatically updated when reading data from the internal GRAM.

- Note: 1. In RGB interface operation (RM = "1"), the address AD16-0 is set in the address counter every frame on the falling edge of VSYNC.
 - 2: In internal clock operation and VSYNC interface operation (RM = "0"), the address AD16-0 is set when executing the instruction.

Table 24 GRAM Address setting range

AD[16:0]	GRAM Data Setting
17'h00000 - 17'h000EF	Bitmap data on the first line
17'h00100 - 17'h001EF	Bitmap data on the second line

17'h00300 - 17'h003EF	Bitmap data on the fourth line
17'h00400 - 17'h004EF	Bitmap data on the fifth line
:	:
17'h13600 - 17'h13CEF	Bitmap data on the 317th line
17'h13700 – 17'h13DEF	Bitmap data on the 318th line
17'h13800 - 17'h13EEF	Bitmap data on the 319th line
17'h13900 - 17'h13FEF	Bitmap data on the 320th line

(20) RAM DATA WRITE/READ (R22H)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1		WD[17:0]														
R	1	RD[17:0]															

WD[17:0]: The UC8230s develops data into 18 bits internally in write operation. The format to develop data into 18 bits is different in different interface operation.

The GRAM data represents the grayscale level. The UC8230s automatically updates the address according to AM and I/D[1:0] settings as it writes data in the GRAM. The DFM bit sets the format to develop 16-bit data into the 18-bit data in 16-bit or 8-bit interface operation.

RD [17:0]: Read 18-bit data from GRAM. The bit assignment for the data that are read out from GRAM is different according to the interface.

When data are read out from GRAM to the microcomputer, the first word read immediately after GRAM address set are latched in the internal read-data latch, and thereby the data in the data bus (DB17–0) are nullified. The second word is read as valid data. When the UC8230s performs an internal bit processing, such as logical operation, the data latched in the read-data latch are used to complete it by single read out operation. The data are expanded internally into 18 bits before going through the logical operation. When the 8-/16-bit interfaces are selected, GRAM data in the LSB of R and B pixels are not read out. This function is not available in the RGB interface mode.

W	1	0	0	0	0	0	0	0				,	VSA[8:0	1			
W	1	0	0	0	0	0	0	0					VEA[8:0]			

HSA[7:0], HEA[7:0]: HSA[7:0] and HEA[7:0] are the start and end addresses of the window address area in horizontal direction, respectively. HSA[7:0] and HEA[7:0] specify the horizontal range to write data.

Set HSA[7:0] and HEA[7:0] before starting RAM write operation. In setting, make sure that 8'h00 ≤ HAS < HEA \leq 8'hEF and 8'h04 \leq HEA – HSA.

VSA[8:0], VEA[8:0]: VSA[8:0] and VEA[8:0] are the start and end addresses of the window address area in vertical direction, respectively. VSA[8:0] and VEA[8:0] specify the vertical range to write data. Set VSA[8:0] and VEA[8:0] before starting RAM write operation. In setting, make sure that 9'h000 ≤ VSA < VEA ≤ 9'h13F.

Window address setting range: $00H \leq HAS[7:0] \leq HEA[7:0] \leq EFH$ $00H \le VAS[8:0] \le VEA[8:0] \le 13FH$

Figure 5 GRAM Address Map and Window Address Area

(29) DRIVER OUTPUT CONTROL (R60H)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	GS	0			NL[5:0]			0	0			SCN	[5:0]		

SCN[5:0]: Specifies the gate line where the gate driver starts scan.

NL[5:0]: Sets the number of lines to drive the LCD at an interval of 8 lines. The GRAM address mapping is not affected by the number of lines set by NL[5:0]. The number of lines must be the same or more than the number of lines necessary for the size of the liquid crystal panel.

GS: Sets the direction of scan by the gate driver. Set GS bit in combination with SM and SS bits for the convenience of the display module configuration and the display direction.

(30) BASE IMAGE DISPLAY CONTROL (R61H)

W/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0	0	0	0	0	0	0	0	0	0	NDL	VLE	REV

REV: Enables the grayscale inversion of the image by setting REV = 1. This enables the UC8230s to display the same image from the same set of data whether the liquid crystal panel is normally black or white. The source output level during front, back porch periods and blank periods is determined by register setting (PTS).

Table 26 GRAM Data-grayscale level inversion

REV	GRAM Data	Source Output Level in	Display Area
		Positive Polarity	Negative Polarity
0	18'h00000	V63	V0
	:	1	1
	18'h3FFFFF	V0	V63
1	18'h00000	V0	V63
	:	:	:
	18'h3FFFFF	V63	V0

VLE: Vertical scroll display enable bit. When VLE = 1, the UC8230s starts displaying the base image from the line (of the physical display) determined by VL[8:0] bits. VL[8:0] sets the amount of scrolling, which is the number of lines to shift the start line of the display from the first line of the physical display.

Note that the partial image display position is not affected by the base image scrolling.

The vertical scrolling is not available in external display interface operation. In this case, make sure to set VLE = "0".

Table 27

VLE	Base image
0	Fixed
1	Enable scrolling

NDL: Sets the source output level in non-lit display area. NDL bit can keep the non-display area lit on.

Table 28

NDI	Non-disp	lay area
INDL	Positive	Negative
0	V63	V0
1	V0	V63

(31) VERTICAL SCROLL CONTROL (R6AH)

Note: Make sure that number of scan start position + number of scan end position is 320 lines or less.

(32) PARTIAL IMAGE 1 DISPLAY POSITION (R80H)

1	N/R	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
	W	1	0	0	0	0	0	0	0				P.	TDP0[8:	0]			

PTDP0[8:0]: Sets the display position of partial image 1. PTDP1[8:0]: Sets the display position of partial image 2.

The display areas of the partial images 1 and 2 must not overlap each another. In setting, make sure that Partial image 1 display area < Partial image 2 display area, and

Coordinates of partial image 1 display position: (PTDP0, PTDP0 + (PTEA0 – PTSA0)) Coordinates of partial image 2 display position: (PTDP1, PTDP1 + (PTEA1 – PTSA1))

If PTDP0 = "9'h000", the partial image 1 is displayed from the first line of the base image.

PTSA0[8:0] and PTEA0[8:0]: Sets the start line and end line addresses of the RAM area, respectively for the partial image 1. In setting, make sure that PTSA0 ≤ PTEA0.

PTSA1[8:0] and PTEA1[8:0]: Sets the start line and end line addresses of the RAM area, respectively for the partial image 2. In setting, make sure that PTSA1 ≤ PTEA1.

RTNI[4:0]: Sets 1H (line) period. This setting is enabled while the UC8230s' display operation is synchronized with internal clock.

DIVI[1:0]: Sets the division ratio of the internal clock frequency. The UC8230s' internal operation is synchronized with the frequency divided internal clock. When DIVI[1:0] setting is changed, the width of the reference clock for liquid crystal panel control signals is changed.

The frame frequency can be adjusted by register setting (RTNI and DIVI bits). When changing the number of lines to drive the liquid crystal panel, adjust the frame frequency too. For details, see "Frame-Frequency Adjustment Function". The setting in DIVI[1:0] is disabled in RGB interface operation.

Frame Frequency Calculation

Frame frequency =
$$\frac{fosc}{Clocks per line x division ratio x (line + BP + FP)}$$
 [Hz]

where, fosc: RC oscillation frequency

Line: Number of lines to drive the LCD (NL bits)

Division ratio: DIVI Clocks per line: RTNI

Table 31 clocks per line (internal clock operation: 1 clock = 1 OSC)

RTNI[4:0]	Clocks per Line	RTNI[4:0]	Clocks per Line	RTNI[4:0]	Clocks per Line
5'h00-5'h0F	Setting inhibited	5'h15	21 clocks	5'h1B	27 clocks
5'h10	16 clocks	5'h16	22 clocks	5'h1C	28 clocks
5'h11	17 clocks	5'h17	23 clocks	5'h1D	29 clocks
5'h12	18 clocks	5'h18	24 clocks	5'h1E	30 clocks
5'h13	19 clocks	5'h19	25 clocks	5'h1F	31 clocks
5'h14	20 clocks	5'h1Δ	26 clocks		

Table 32 Division ratio of the internal clock

DIVI[1:0]	Division Ratio	Internal operation clock unit
2'h0	1/1	1 OSC
2'h1	1/2	2 OSC
2'h2	1/4	4 OSC
2'h3	1/8	8 OSC

NOWI[2:0]: Sets the non-overlap period of adjacent gate outputs. The setting is enabled in display operation synchronizing with the internal clock.

Table 33

NOWI[2:0]	Non-overlap period	NOWI[2:0]	Non-overlap period
3'h0	0 (internal clock *see note)	3'h4	4 (internal clock *see note)
3'h1	1	3'h5	5
3'h2	2	3'h6	6
3'h3	3	3'h7	7

Note: The internal clock is the frequency divided clock, which is set by DIVI[[1:0] bits.

MCPI[2:0]: Sets the source output timing by the number of internal clock from the reference point. The setting is enabled in display operation synchronizing with the internal clock.

Table 34

MCPI[2:0]	Source output position	MCPI[2:0]	Source output position
3'h0	0 (internal clock *see note)	3'h4	4 (internal clock)
3'h1	1	3'h5	5
3'h2	2	3'h6	6
3'h3	3	3'h7	7

Note: The internal clock is the frequency divided clock, which is set by DIVI[[1:0] bits. The source output position is measured from the reference point by the number of internal clock cycle.

RTNE[5:0]: Sets RTNE[5:0] and DIVE[1:0] bits so that the number of DOTCLK calculated from the following formula becomes the number of DOTCLK which should be inputted in 1H period. The RTNE[5:0] setting is enabled in display operation via RGB interface.

DIVE[1:0] (division ratio) x RTNE[5:0] (Number of DOTCLK) ≤ Number of DOTCLK in 1H period

DIVE[1:0]: Sets the division ratio of DOTCLK frequency. The R61505U's internal operation is synchronized with the frequency divided DOTCLK. The setting in DIVE[1:0] is enabled in RGB interface operation.

Table 35 Division ratio of DOTCLK

DIVE	5		Internal operation c	lock unit (DOTCLK)	
[1:0]	Division Ratio	18-bit, 1 transfer RGB interface	DOTCLK = 5 MHz	8-bit, 3 transfers RGB interface	DOTCLK = 15 MHz

INTERFACES

INTERFACE SPECIFICATION

The UC8230s incorporates a system interface, which is used to set instructions, and an external display interface, which is used to display motion pictures. Selecting these interfaces to match the screen data (motion picture or still picture) enables efficient transfer of data for display.

The external display interface includes RGB interface and VSYNC interface. This allows flicker-free screen update.

When RGB interface is selected, the synchronization signals (VSYNC, HSYNC, and DOTCLK) are available for use in operating the display. The data for display (DB17-0) is written according to the values of the data enable signal (ENABLE) and data valid signal (VLD), in synchronization with the VSYNC, HSYNC, and DOTCLK signals. In addition, using the window address function enables rewriting only to the internal RAM area to display motion pictures. Using this function also enables simultaneously display of the motion picture area and the RAM data that was written.

While displaying motion pictures, the data for display should be written in high-speed write mode, which achieves both low power consumption and high-speed access via RGB interface or VSYNC interface.

The internal display operation is synchronized with the frame synchronization signal (VSYNC) in VSYNC interface mode. When writing to the internal RAM is done within the required time after the falling edge of VSYNC, motion pictures can be displayed via the conventional interface. There are some limitations on the timing and methods of writing to RAM. See the section on the external display interface.

The UC8230s has four operation modes for each display state. These settings are specified by control instructions for external display interface. Transitions between modes should follow the transition flow.

RAM Access Selection and Display Operation Mode

Operation Mode	RAM Access Selection (RM)	Display Operation Mode (DM1-0)
Internal Clock Operation (Displaying still picture)	System interface (RM=0)	internal clock operation (DM1-0=00)
RGB interface(1) - (Display motion picture)	RGB interface (RM=1)	RGB interface (DM1-0=01)
RGB interface(2) - (Rewriting still picture while display motion picture)	System interface (RM=0)	RGB interface (DM1-0=01)
VSYNC interface (Displaying motion pictures)	System interface (RM=0)	VSYNC interface (DM1-0=10)

Note: 1) Set instruction registers only via system interface.

- 2) Do not use RGB interface and VSYNC interface at the same time.
- 3) Do not set RGB interface mode during operation.
- 4) For mode transitions, see the section on the external display interface.

HOST INTERFACE

High-Voltage Mixed-Signal IC

As summarized in the table below, UC8230s supports two parallel bus protocols, in any of 18/16/9/8-bit bus width, and bus protocols.

Designers can either use parallel buses to achieve high data transfer rate, or use serial buses to create compact LCD modules.

						Bus Type							
			80	80			SPI						
	Width	18-bit	16-bit	9-bit	8-bit	18-bit	16-bit	9-bit	8-bit	Serial

8080/6800 9-BIT BUS INTERFACE

Setting the IM3/2/1/0 (interface mode) to the $IOV_{CC}/V_{SS}/V_{SS}/IOV_{CC}$ level allows 68-system 9-bit parallel data transfer using pins DB17–DB9. Setting the IM3/2/1/0 to be $IOV_{CC}/V_{SS}/IOV_{CC}/IOV_{CC}$ level allows 80-system 9-bit parallel data transfer. The 16-bit instructions and RAM data are divided

into nine upper/lower bits and the transfer starts from the upper nine bits. Fix unused pins DB8–DB0 to the IOV_{CC} or V_{SS} level. Note that the upper bytes must also be written when the index register is written.

RAM Data Write format for 9-bit interface

The UC8230s supports the transfer synchronization function, which resets the upper/lower counter to count upper/lower 9-bit data transfer in the 9-bit bus interface. Noise causing transfer mismatch between the nine upper and lower bits can be corrected by a reset triggered by consecutively writing a "00"H instruction four times. The next transfer starts from the upper nine bits. Executing synchronization function periodically can recover any runaway in the display system.

8080/6800 8-BIT BUS INTERFACE

Setting the IM3/2/1/0 (interface mode) to the $V_{SS}/V_{SS}/IOV_{CC}$ level allows 68-system 8-bit parallel data transfer. Setting the IM3/2/1/0 to the $V_{SS}/V_{SS}/IOV_{CC}/IOV_{CC}$ level allows 80-system 8-bit parallel data transfer. The 16-bit instructions and

RAM data are divided into eight upper/lower bits and the transfer starts from the upper eight bits. Fix unused pins DB9–DB0 to the IOV_{CC} or V_{SS} level. Note that the upper bytes must also be written when the index register is written.

Instruction format for 8-bit

RAM Data Write format for 8-bit interface

The UC8230s supports the transfer synchronization function, which resets the upper/lower counter to count upper/lower 8-bit data transfer in the 8-bit bus interface. Noise causing transfer mismatch between the eight upper and

lower bits can be corrected by a reset triggered by consecutively writing a "00"H instruction four times. The next transfer starts from the upper eight bits. Executing synchronization function periodically can recover any runaway in the display system

Serial Interface

Setting the IM3 pin to the V_{SS} level allows serial peripheral interface (SPI) transfer, using the chip select line (CS*), serial transfer clock line (SCL), serial input data (SDI), and serial output data (SDO). For a serial interface, the IM0/ID pin function uses an ID pin. If the chip is set up for serial interface, the DB17-2 pins that are not used must be fixed at IOV $_{CC}$ or V_{SS} .

The UC8230s initiates serial data transfer by transferring the start byte at the falling edge of CSB input. It ends serial data transfer at the rising edge of CSB input. The UC8230s is selected when the 6-bit chip address in the start byte matches the 6-bit device identification code that is assigned to the UC8230s. When selected, the UC8230s receives the subsequent data string. The LSB of the identification code can be determined by the ID pin. The five upper bits must be 01110.

Two different chip addresses must be assigned to a single UC8230s because the seventh bit of the start byte is used as a register select bit (RS):

that is, when RS = 0, data can be written to the index register or status can be read, and when RS = 1, an instruction can be issued or data can be written to or read from RAM. Read or write is selected according to the eighth bit of the start byte (R/W bit). The data is received when the R/W bit is 0, and is transmitted when the R/W bit is 1. After receiving the start byte, the UC8230s receives or transmits the subsequent data byte-by-byte. The data is transferred with the MSB first.

All UC8230s instructions are of 16 bits. Two bytes are received with the MSB first (DB17 to 0), then the instructions are internally executed. After the start byte has been received, the first byte is fetched as the upper eight bits of the instruction and the second byte is fetched as the lower eight bits of the instruction. Four bytes of RAM read data after the start byte are invalid. The UC8230s starts to read correct RAM data from the fifth byte.

Transfer Bit	S	1	2	3	4	5	6	7	8
Start byte format	T			Device I	D code	!	1	RS	R/W
	Transfer start	0	1	1	1	0	ID

EXTERNAL DISPLAY INTERFACE

The following interfaces are available as external display interface. It is determined by bit setting of RIM1-0. RAM accesses can be performed via the RGB interface.

RIM1	RIM0	RGB Interface	DB Pin
0	0	18-bit RGB interface	DB17 to 0
0	1	16-bit RGB interface	DB17 to 13, 11 to 1
1	0	6-bit RGB interface	DB17 to 12
1	1	Setting disabled	

1. RGB INTERFACE

The RGB interface is performed in synchronization with VSYNC, HSYNC, and DOTCLK. Combining the function of the high-speed write mode and the window address enables transfer only the screen to be updated and reduce the power consumption.

Figure 17: RGB Interface

RGB INTERFACE TIMING

VLW: The period in which VSYNC is "Low" level HLW: The period in which HSYNC is "Low" level

DTST: Set up time of data transfer

NOTE: Data for display should be written in the high-speed write mode (HWM="1") in VSYNC is in use.

DISPLAY OF MOVING PICTURE

The UC8230s incorporates RGB interface to display motion pictures and RAM to store data for display. For displaying motion pictures, the UC8230s has the following features.

- Motion picture area can only be transferred by the window address function.
- The high-speed write mode achieves both low power consumption and high-speed access.
- Motion picture area to be rewritten can only be transferred.
- Reducing the amount of data transferred enables reduce the power consumption to the whole system.
- Still picture area, such as an icon, can be updated while displaying motion pictures combining with the system interface.

High-Voltage Mixed-Signal IC ©1999 ~ 2008

RAM ACCESS VIA RGB INTERFACE AND SYSTEM INTERFACE

RAM can be accessed via the system interface when RGB interface is in use. When data is written to RAM during RGB interface mode, the ENABLE bit should be low to stop data writing via RGB interface, because RAM writing is always performed in synchronization with the DOTCLK input when ENABLE is high. After this RAM access via the system interface, a waiting time is needed for a write/read bus cycle before the next RAM access starts via RGB interface. When a RAM write conflict occurs, data writing is not guaranteed. Example of display motion picture via RGB-I/F and updating still picture via the system interface are shown below.

Figure 18: Example of Updating Still Picture Area During Display Motion Picture

18-BIT RGB INTERFACE

18-bit RGB interface can be used by setting MIF1-0 pins to 01. Display operation is synchronized with VSYNC, HSYNC, and DOTCLK signals. Data for display is transferred to the internal RAM via 6-bit RGB data bus (DB17-0).

Figure 19. 18-bit interface

GRAM Write Data format for 18-bit RGB Interface

16-BIT RGB INTERFACE

16-bit RGB interface can be used by setting RIM1-0 pins to 01. Display operation is synchronized with VSYNC, HSYNC, and DOTCLK signals. Data for display is transferred to the internal RAM via 6-bit RGB data bus (DB17-13 and 11-1). Instruction should be set via the system interface.

Figure 20: 16-bit interface

16-bit RGB Interface (65,536 Colors)

GRAM Write Data format for 16-bit RGB Interface

©1999 ~ 2008

6-BIT RGB INTERFACE

High-Voltage Mixed-Signal IC

6-bit RGB interface can be used by setting RIM1-0 pins to "00". Display operation is synchronized with VSYNC, HSYNC, and DOTCLK signals. Data for display is transferred to the internal RAM via 6-bit RGB data bus (DB17 to 12), and the data enable signal (ENABLE). Unused pins must be fixed to the V_{DD3} or GND level.

Figure 21. 6-bit interface

GRAM Write Data format for 6-bit RGB Interface

NOTE: Transfer synchronization function for an 6-bit bus interface. The UC8230s has the transfer counter to count 1st, 2nd and 3rd data transfer in the 6-bit bus interface. The transfer counter is reset on the falling edge of VSYNC and enters the 1st data transmission state. Transfer mismatch can be corrected transfer restarts correctly. In this method, when data is consecutively transferred such as displaying motion pictures, the effect of transfer mismatch will be reduced and recover normal operation.

NOTE: The internal display is operated in units of three DOTCLK. When the DOTCLK is not input in units of pixels, click mismatch occurs and the frame, which is operated, and the next frame are not display correctly.

⇒ 1st byte of Write data: 11111111b

⇒ 2nd byte of Write data: 11111111b

Gamma-Correction Register

The Gamma-adjustment register is a group of registers to set an appropriate gray scale voltage for the gamma-characteristics of a liquid crystal panel. The register group is categorized into the ones adjusting gradient, amplitude, and fine-tuning in relation to grayscale number and grayscale voltage characteristics. Each register can make an independent setting for the positive/negative polarity. The reference value and RGB are common to both polarities.

1. Gradient adjustment registers

The gradient adjustment registers are used to adjust the gradient around the middle of the grayscale number and voltage characteristics without changing a dynamic range. To adjust a gradient, the values of the variable resistors (VRHP (N)/VRLP (N)) in the middle of the ladder resistor block for grayscale voltage generation are controlled. The registers incorporate separate registers for positive and negative polarities to be compatible with asymmetric drive.

1. Gradient adjustment resister

2. Amplitude adjustment registers

The amplitude adjustment registers are used to adjust the amplitude of the grayscale voltage. To adjust the amplitude, the values of the variable resistors (VRP(N)1/0) in the bottom of the ladder resistor block for grayscale voltage generation are adjusted. Same with the gradient registers, the amplitude adjustment registers also incorporate separate registers for positive and negative polarities.

2. Amplitude adjustment

3. Fine adjustment registers

The fine adjustment register is to fine-adjust the grayscale voltage level. To fine-adjust the grayscale voltage level, each level of 8-level reference voltages generated from the ladder registers is controlled by 8- to -1 selector. Same with the other registers, the fine-adjustment registers also incorporate separate registers for positive and negative polarities.

Gamma Correction registers

11111	31R			

8-to-1 Selector

The 8-to-1 selectors select a voltage level generated by the ladder resistors according to the fine adjustment registers, and output six kinds of reference voltage, VIN1 to VIN 6. The relationship between the fine adjustment register and the selected voltage is as follows.

Relationship between Micro-adjustment Register and selected Voltage

		Selected voltage				
Register value PKP(N) [2:0]	VINP(N)1	VINP(N)2	VINP(N)3	VINP(N)4	VINP(N)5	VINP(N)6
000	KVP(N)1	KVP(N)9	KVP(N)17	KVP(N)25	KVP(N)33	KVP(N)41
001	KVP(N)2	KVP(N)10	KVP(N)18	KVP(N)26	KVP(N)34	KVP(N)42
010	KVP(N)3	KVP(N)11	KVP(N)19	KVP(N)27	KVP(N)35	KVP(N)43
011			KVP(N)20			
100	KVP(N)5	KVP(N)13	KVP(N)21	KVP(N)29	KVP(N)37	KVP(N)45
101	KVP(N)6	KVP(N)14	KVP(N)22	KVP(N)30	KVP(N)38	KVP(N)46

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Min.	Max.	Unit
V _{CC}	LCD Generator Supply voltage	-0.3	+4.0	V
IOV _{CC}	Interface pin power supply	-0.3	+4.0	V
V _{D4}	Analog Circuit Supply voltage	-0.3	+6.0	V
VccH - VccL	LCD Gate Driving voltage	-0.3	+27	V
V_{IN}	Digital input signal	-0.4	$V_{DD} + 0.5$	V
T _{OPR}	Operating temperature range	-30	+85	°C
T _{STR}	Storage temperature	-55	+125	°C

Note:

- 1. V_{DD} is based on $V_{SS} = 0V$.
- 2. Stress beyond ranges listed above may cause permanent damages to the device.

SPECIFICATIONS

DC CHARACTERISTICS

Symbol	Parameter	Conditions	Min.	Тур.	Max.	Unit
V _{CC}	LCD Generator Supply voltage		2.5		3.3	V
IOVcc	Interface pin power supply		1.65		3.3	V
V _{D4}	V _{D4} pumpout		4		5.5	V
V _{CC} H	V _{CC} H pumpout		10		15	V
V _S N	V _S N pumpout		-2.3			V
V _{CC} L	V _{CC} L pumpout		-12		-8	V
V_{IL}	Input logic LOW				$0.2V_{DD}$	V
V _{IH}	Input logic HIGH		$0.8V_{DD}$			V
V_{OL}	Output logic LOW				$0.2V_{DD}$	V
V_{OH}	Output logic HIGH		0.8V _{DD}			V
I _{IL}	Input leakage current				1.5	μА
C _{IN}	Input capacitance			5	10	PF

Note: Voltages exceeding the Max. value may still keep the IC operating properly, yet might shorten its lifetime.
